With a p-value of < 0.05 , we reject the null hypothesis: the conversion rates significantly differ between the campaigns. All three pairwise comparisons remained significant after Bonferroni correction ($\alpha = 0.0167$).

RECOMMENDATIONS

→ Campaign 1178 generated the majority of conversions (80.82%) but also consumed 94.82% of total spend. Its CPC (Cost-per-click) was only modestly higher than the other campaigns, while its conversion rate was substantially lower (2.42%). This suggests that the primary performance gap may occur after users click rather than at the click-acquisition stage. 1178 deserves investigation at the funnel/segment level because its very large spend isn't translating proportionally into conversions.

→ Even though Campaign 916 technically
